

Kenna.VI

Rich, Real-Time Threat Intelligence at Your Fingertips

KENNA.VI (Vulnerability Intel) is a comprehensive research tool that allows enterprises to search Kenna Security's vast exploit and vulnerability intelligence databases. Rely on Kenna.VI to research and understand vulnerabilities in your environment and in the wild, while keeping track of major trends.

Vulnerabilities are scored by Kenna. We then enrich that vulnerability data with attack and exploit information which encompasses more than 7 billion managed vulnerabilities and 15+ exploit and threat intelligence feeds. Leveraging supervised machine learning algorithms, Kenna.VI analyzes this information to provide a unified source of intelligence that you can't get anywhere else.

The Broadest Array of Threat and Exploit Intel

Malware Activity

Detailed information about what malware uses the exploitation of vulnerabilities as part of their attack vector, with hashes provided to help identify specific strains.

Exploit Kits

Detailed information about which vulnerabilities have been weaponized within the latest versions of exploit kits, plus specific intelligence on the exploit kit itself.

Exploit Predictions

Supervised machine learning algorithms help deliver visibility into the leading indicator of volume exploitation: the probability that a newly published vulnerability will be weaponized.

Volume and Velocity

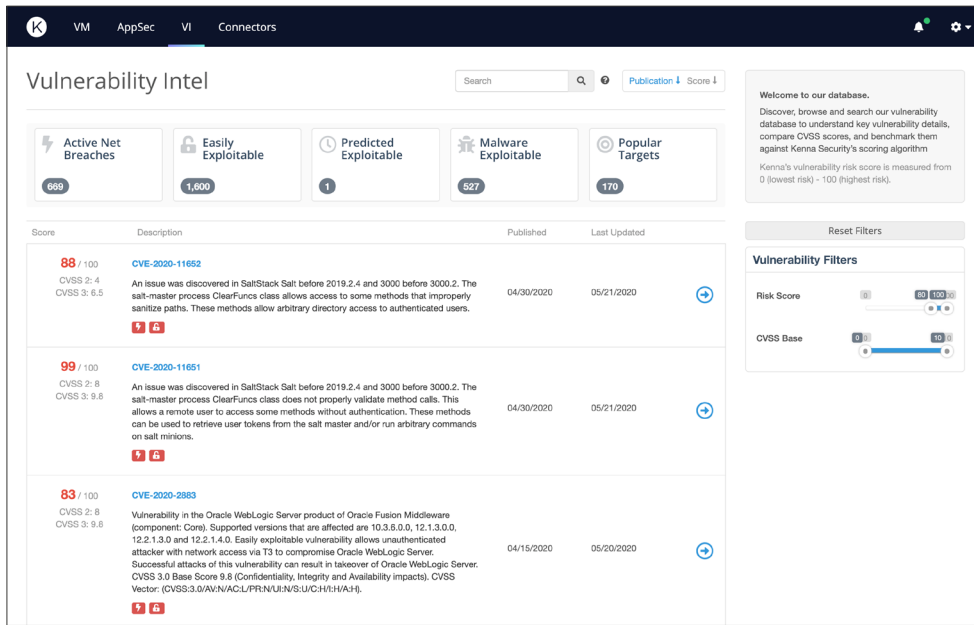

Detailed and specific volume, velocity, and rate of change information about specific vulnerabilities based on data from our global network of sensors.

Popular Targets

Insights into vulnerability prevalence across Kenna's customer base to determine which vulnerable software and operating systems are most likely to be targets of opportunity for attackers.

Vulnerability and Exploit Attributes

In Kenna.VI, you'll harness detailed attributes to access specific information about each vulnerability. They include Common Vulnerability Scoring System (CVSS) data, remediation, vulnerability velocity, vulnerability volume, predicted exploitable, malware exploitable, easily exploitable, exploit, fixes, malware, successful exploitations, and more.

Kenna Intelligence Feeds

EXPLOIT INTELLIGENCE

- Metasploit
- Exploit DB
- ReversingLabs
- Proofpoint
- Secureworks CTU
- D2 Elliot
- Contagio
- Black Hat Kits on rotation (AlphaPack, Blackhole, Phoenix, more)

THREAT INTELLIGENCE

- AlienVault OTX
- AlienVault Reputation
- Secureworks CTU
- Emerging Threats
- ReversingLabs
- Exodus Intelligence
- SANS Internet Storm Center
- X-Force Exchange

Benefits

RAPID RESPONSE

When a new vulnerability is making headlines, it's not uncommon for a security team to field questions about it, whether it's in their environment or not. Kenna.VI arms security teams with all the information they need to create a plan of action and respond quickly and authoritatively.

FOCUS ON RISK

Kenna scores every vulnerability so you can always focus on the vulnerabilities that pose the most risk to the organization.

AUTHORITATIVE RESEARCH

Search and browse a comprehensive database of vulnerabilities enriched with exploit and threat meta-data. Identify fixes and determine whether the vulnerability was used in a breach or malware, if an exploit was published, and much more.

PREDICTIVE EXPLOIT MODELING

Know the level of risk vulnerabilities pose—the instant they're discovered—with predictive modeling technology.

COMPREHENSIVE INTEL

The most robust unified source of intelligence for vulnerabilities available anywhere.
